

National Aeronautics and Space Administration

# Terminal Area Procedures for Paired Runways

Sandy Lozito and Savvy Verma  
NASA

A Joint Airspace Systems Program, Aviation Safety Program, and FAA Study

Airspace Systems Program  
2011 Technical Interchange Meeting  
March 28–31 2011  
San Diego, CA  
[www.nasa.gov](http://www.nasa.gov)

# Objective

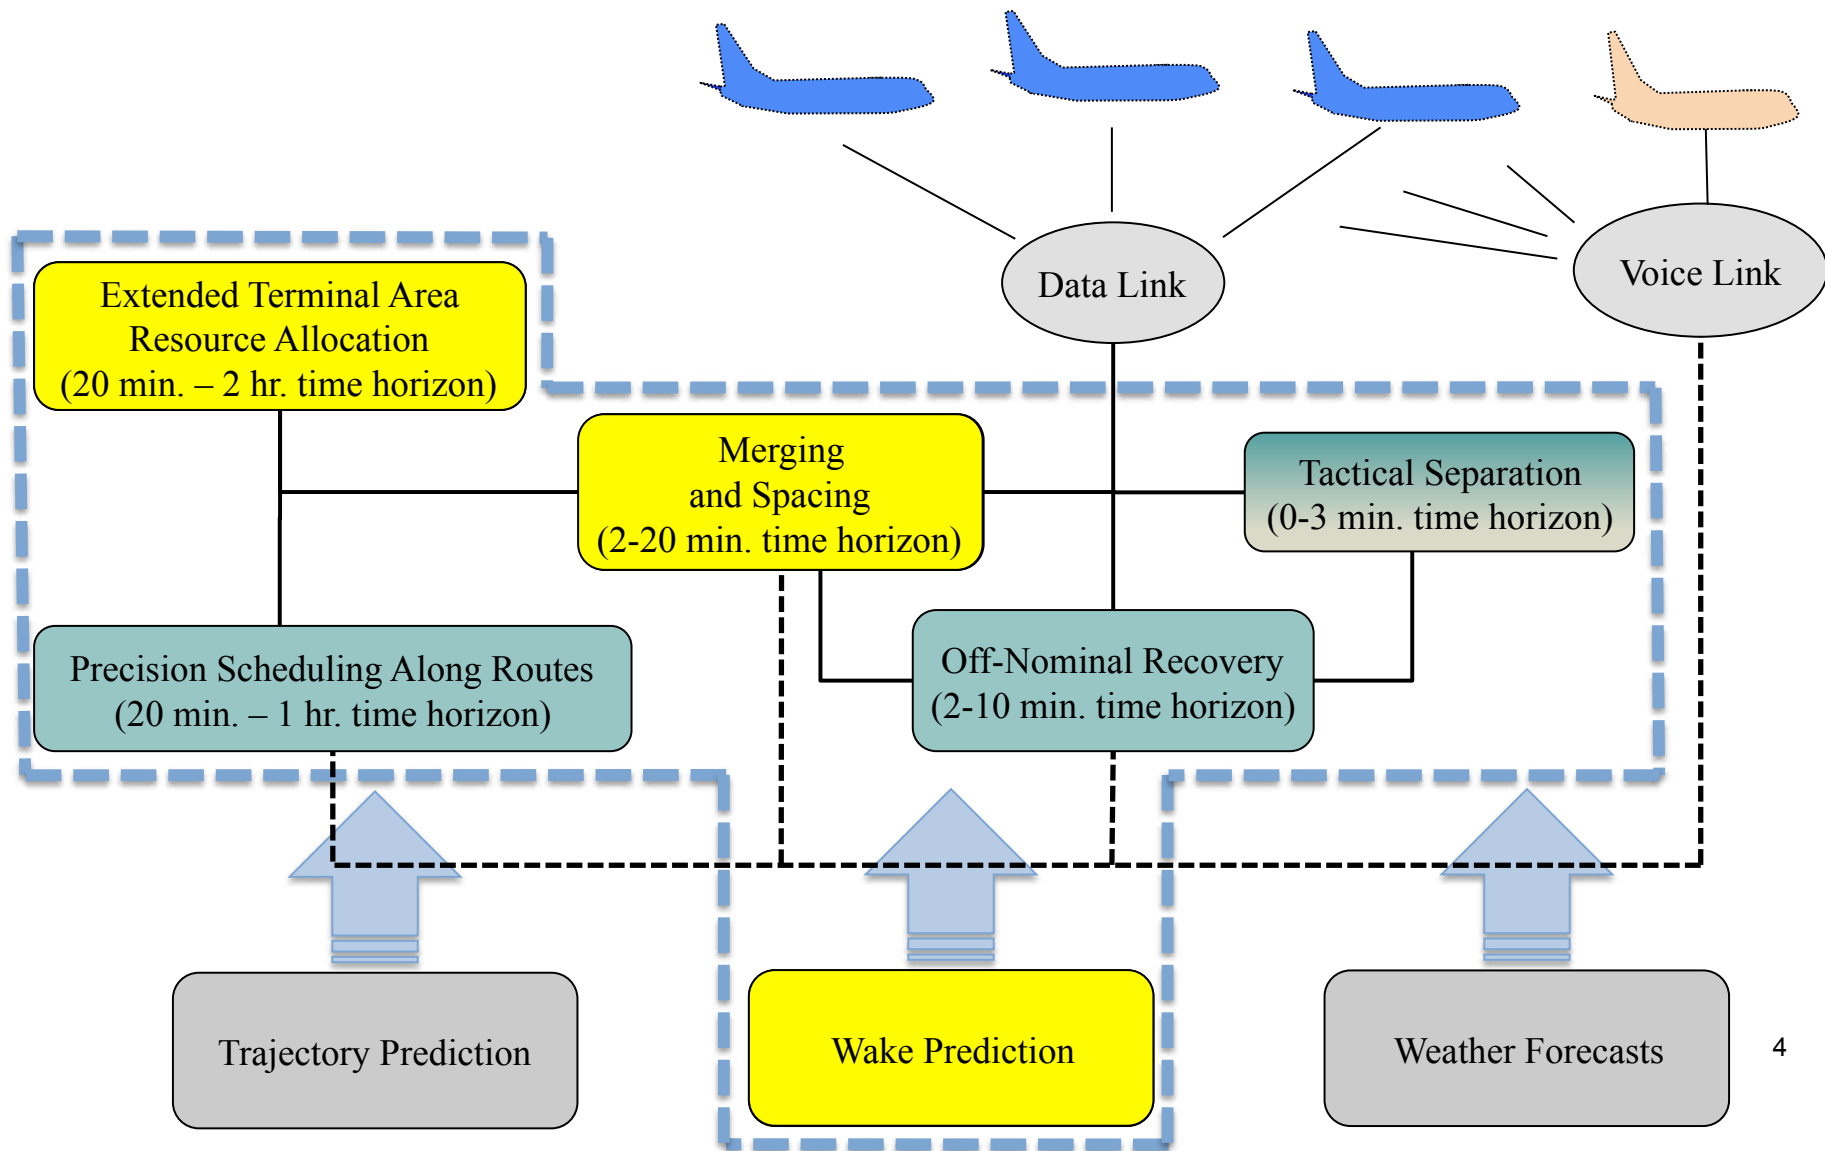

- To investigate integrated procedures for flight deck and air traffic control in the terminal area for simultaneous approaches
  - Levels of flight deck automation
  - Roles of the air traffic controller and the flight crew in pairing aircraft and monitoring their conformance

# Motivation

- Significant efficiency and capacity are lost when poor weather conditions limit operations on parallel runways closer than 4300ft.
- The FAA would like to reduce runway separation from 4300ft to 2500ft and even to 750ft.
- NextGen has the goal to increase capacities under all weather conditions on airports with parallel runways <4300ft apart.
- Previous studies investigated roles of pilots and controllers separately, and examined aircraft that are already paired.
  - This study examines the integrated dynamic role of pilots and controllers, as well as procedures and tools for the actual pairing.

# Very Closely-Spaced Parallel Runway Operations

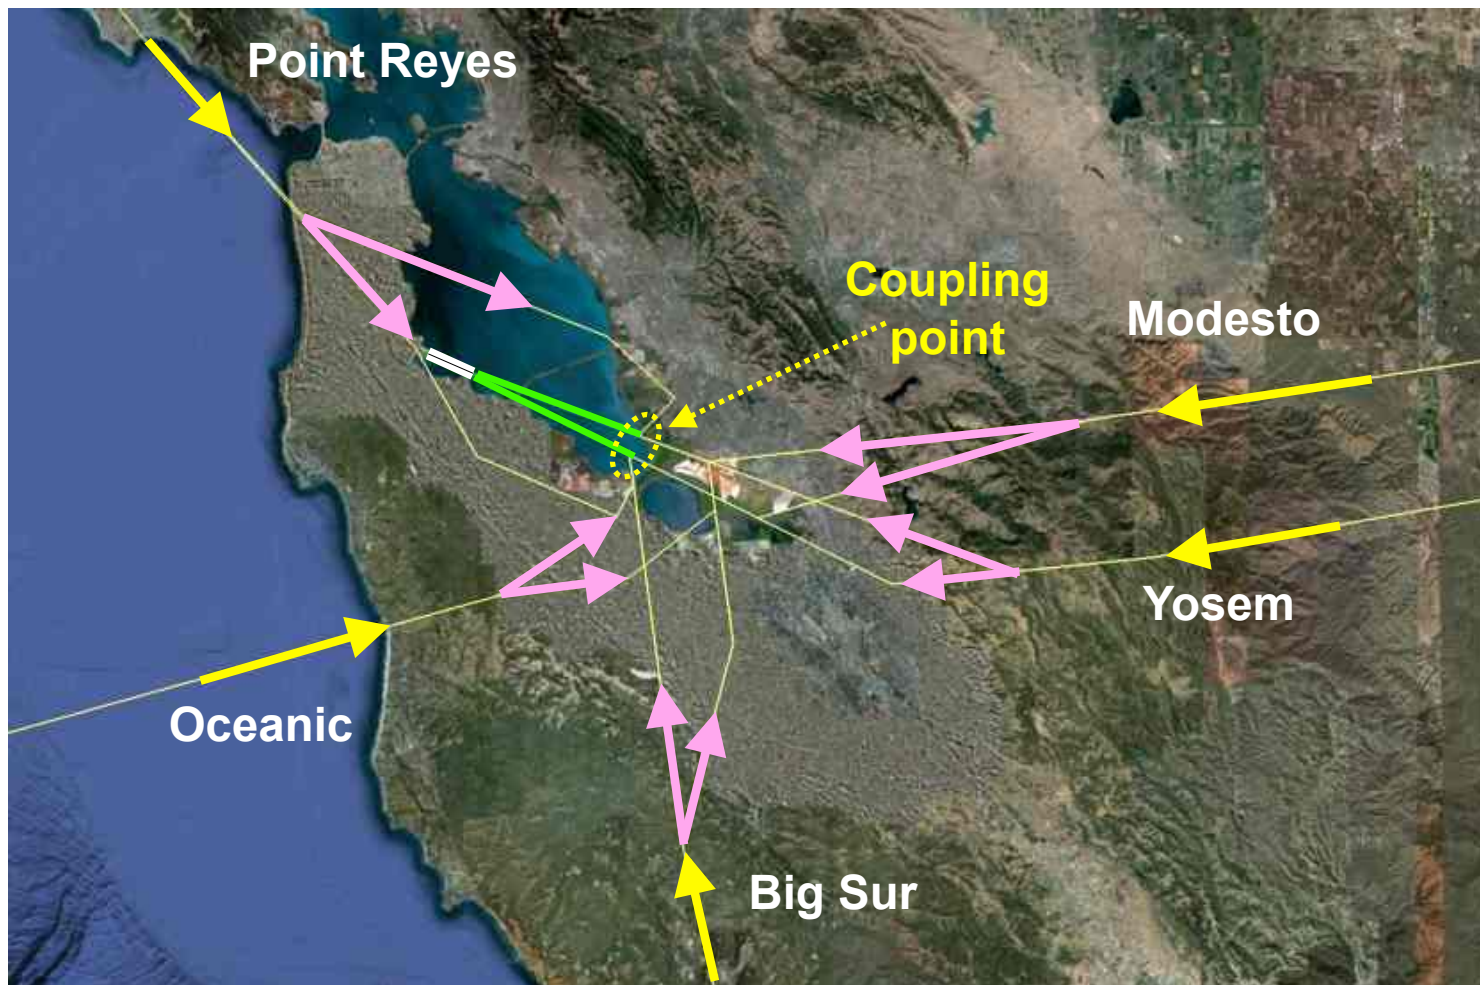

# Concept

- Technology assumed (Far Term 2025)
  - Differential Global Positioning System (DGPS)
  - Augmented Automatic Dependent Surveillance-Broadcast (ADS-B)
  - Augmented cockpit display
  - Required Navigation Performance (RNP) 1.11
- Aircraft are provided 4D trajectories and managed simultaneously to the coupling point, 12 nmi from threshold
  - Coupling point is when the automation of the two aircraft are sharing data and are linked to one another through the aircraft automation
- Maintain precise time separation of 5-25 s
- Speed adjustments only to meet Required Time of Arrival (RTA)

# San Francisco Arrivals

# Experimental Conditions: Flight Deck

- Functionality
  - Automation to auto-control aircraft speed and capture, then maintain, a pair
    - Future/Paired Dependent Spacing, or PDS)
  - FMS ETA information (current day)
- Displays for pairing conformance monitoring
  - Graphical display set 1: distance error relative to a desired position in the profile
  - Graphical display set 2: ETA prediction based upon current ground speed

## Experimental Conditions: ATC

- ❑ Three positions (modified San Francisco Airspace): Niles, Boulder and Area Coordinator
- ❑ Ground side automation provides one optimal pairing solution (but controller can override at any time)
- ❑ An aircraft may be paired with an aircraft from any of the other 5 streams but not the same stream (to avoid overtake)
- ❑ Sector controllers are responsible for standard separation between pairs of aircraft (and singles)
  - Sector controllers are not responsible for aircraft spaced with less than standard separation (4-5 nmi before Coupling point to threshold)
- ❑ Sector controllers will control leader aircraft
  - Sector controllers will not try to space/control trailer aircraft normally, only by exception

# Methods

- ❑ Human-in-the-loop simulation
- ❑ Conducted in June/July 2010
- ❑ SFO airspace used (modified for procedures)
- ❑ Our participants always flew in the trailing aircraft position
- ❑ Participants: 6 flight crews, 3 controller teams
- ❑ Advanced Concept Flight Simulator (ACFS) and ATC simulator
- ❑ Number of data collection runs
  - ❑ 9 runs per crew
  - ❑ 18 runs per controller team
- ❑ Training and practice scenarios for participants

# SFD Pairing/Coupling Page when Future Automation (PDS) is Available

## PAIRING CONTROL

Lead aircraft UAL459 (B747-400)  
Current speed = 320 knots  
Planned approach speed = 134 knots  
ETA at couple point ROMEO = 17:50:25

Ownship ETA at couple point LEEMA = 17:50:42

Required spacing interval = 15sec (+/-10s)  
Current spacing error = +2 sec  
Coupling status = ON TIME

# Controller Tools and Displays

# Area Coordinator – How to select pairs offered by automation?

# Area Coordinator – How to select pairs offered by automation?

If pair is acceptable, highlight pair in table and press “send”

Existing/Planned Aircraft Pairs		
Send	Locate	Delete
<b>Proposed pair created</b>		
LEADER	TRAILER	
VRD925	AAL463	

Aircraft pair turns amber and data link message is sent to both aircraft

UAL841	-----	EVA620
--------	-------	--------

Call signs of both aircraft turn green after acknowledge is received

BAW3587	-----	PAL919
UAL841	-----	EVA620

# Conformance Monitoring - Will the pair make the 15s temporal separation at coupling point?

Select “Show Conformance”

Conformance bars on the follower aircraft

If out of conformance, then aircraft pairing may be canceled

# Preliminary Results

# Preliminary Pilot Results

## Pairing Performance for ACFS Crews (the trailing aircraft)

- ❑ The participant crews were able to successfully pair in all cases
- ❑ Our crews did not cancel any pairs
- ❑ There were no losses of separation

# Pilot Workload

- Crews conducting pairing procedures indicated relatively low workload levels
- Mean of about 3, with scale of 1-7

# Pilot Situation Awareness

- Situation awareness measures revealed medium to high situation awareness for pilots across all variables examined in this study
  - There were no significant differences for automation levels or conformance monitoring display types

## Pilot Questionnaire Data

- Procedures were feasible and safe
- Display 1 (current state) v. Display 2 (predictive data)
  - Crews felt that were more accurate with Display 1
- Display 2, which used predictive data, was confusing to interpret
  - Predictive data caused display features to change too rapidly
- Infrequency of use of the procedures may lead to problems with training and implementation

# Preliminary Controller Results

## Pairing Performance for Controllers

- ❑ Controllers were able to successfully pair our ACFS simulator all cases
- ❑ There were no losses of separation

## Pairing Performance for Controllers (Per Run)

# Controller Workload (by position)

# Controller Situation Awareness

- Situation awareness measures revealed medium to high situation awareness for controllers
  - There were no significant differences among the three controller positions for situation awareness

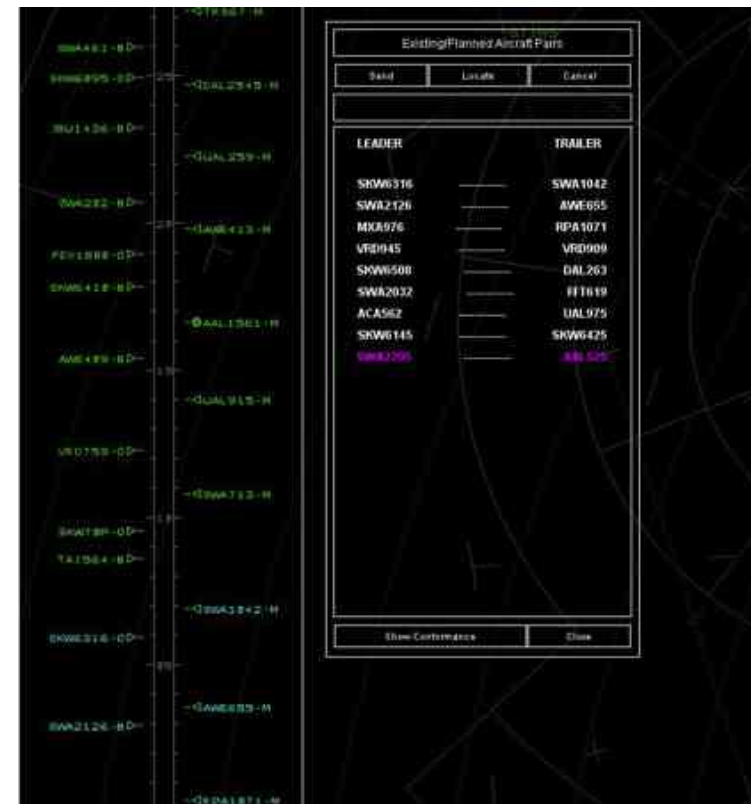

# Technology Transfer

## Simultaneous Offset Instrument Approach (SOIA)

- Simultaneous Offset Instrument Approach (SOIA) demonstration by NASA for the FAA (April 2011)

- Objective: To reduce the cloud ceiling from 2100 ft to 1600 ft by providing the controllers with tools to help with set up the simultaneous approaches
- Technology transfer includes use of pairing and conformance monitoring tools from TAPPR

# Possible Future Work

- ☐ Information requirements necessary for pilots and controllers when conducting pairing operations for parallel runways
- ☐ Roles of the users and automation
- ☐ Determine the conditions that may cause pairing cancellation
- ☐ Impact of cancellations on arrival procedures
- ☐ Impact of off-nominals

# Back Up Slides

# Operations

- ❑ Aircraft may be paired from any of the five arrival streams.
- ❑ Two consecutive aircraft from the same stream may not be paired.
- ❑ The TRACON boundary will be the freeze horizon for the pairing algorithm / automation.
- ❑ An aircraft is not allowed to overtake another aircraft in the same stream
- ❑ All adjustments to flight trajectories to meet ETAs will be made by speed adjustment only, not path stretching or shortening.
- ❑ Paired aircraft must arrive at the coupling point with the trailer between 5 and 25 seconds behind the leader.
  - 5-25 second spacing parameter is based upon avoidance of wake

# Additional Pilot Feedback

- Additional Flight Deck Information Requested
  - Countdown of number of miles to coupling point
  - Trend line
  - Lead aircraft's altitude
  - Lead aircraft's flight path
  - Recommended speed bug

# Controller Questionnaire Data

# Area Coordinator- how to select pairs?

- 5 seconds after both acknowledgements are received, the color of the pair in the pair-table changes to white, indicating the pair is finalized
- The finalized pair is now displayed to all controllers in their respective pair-tables
- The finalized pair also turns blue/cyan on the timeline.

# When to delete a Pair?

- If the aircraft seems to go out of conformance, which leads to the alerts showing the aircraft is early (pink) or late (blue) in the pairs table.

OR

- If the trailing aircraft needs speed adjustments that cannot be made while flight deck automation is engaged.

OR

- If the pilot calls in saying “Unable to maintain pair due to ...”
